

A tried and tested system for the diagnostic testing of structures

The EUROCONSULT-OSMOS system for monitoring buildings, historical monuments, bridges and other civil engineering structures and industrial facilities provides long-term surveillance and records the actual behaviour of structures via special sensors installed on them.

The Euroconsult-Osmos system can monitor static and dynamic effects with the same equipment. Changes in shape and position can be monitored with a precision of up to 1/1000 mm. This continuous monitoring enables the behaviour of structures to be predicted. All data are recorded and can be displayed in real-time.
